

The role people want, from motives and from how they relate to their own place

Standardised estimates. Orange paths lower the wish for mastery, blue paths raise it; grey are loadings.

WLSMV, n = 2,489, ordinal indicators. Country dummies are in the model but not drawn (none reaches p < .05). The own-place latent correlates .36 with restorative, .36 with dialogic and -.28 with serviced.

Own place is the personal counterpart of the role item, so its path is partly the same construct measured twice; the motive paths shift once it is included. Source: 18\_place\_relationship.R
