

Same model, two outcomes: the personal relationship to a place matters far more for wanting mastery than for seeing it

Standardised paths. Coloured = $p < .05$ (orange lowers, blue raises); grey = not significant. * = the path differs between the two panels (Wald $p < .05$). Latent variables show their indicator counts.

WLSMV, $n = 2,489$; country dummies are in the model, not drawn. The two outcomes keep a residual correlation of .43. Source: 19_now_vs_should_sem.R
