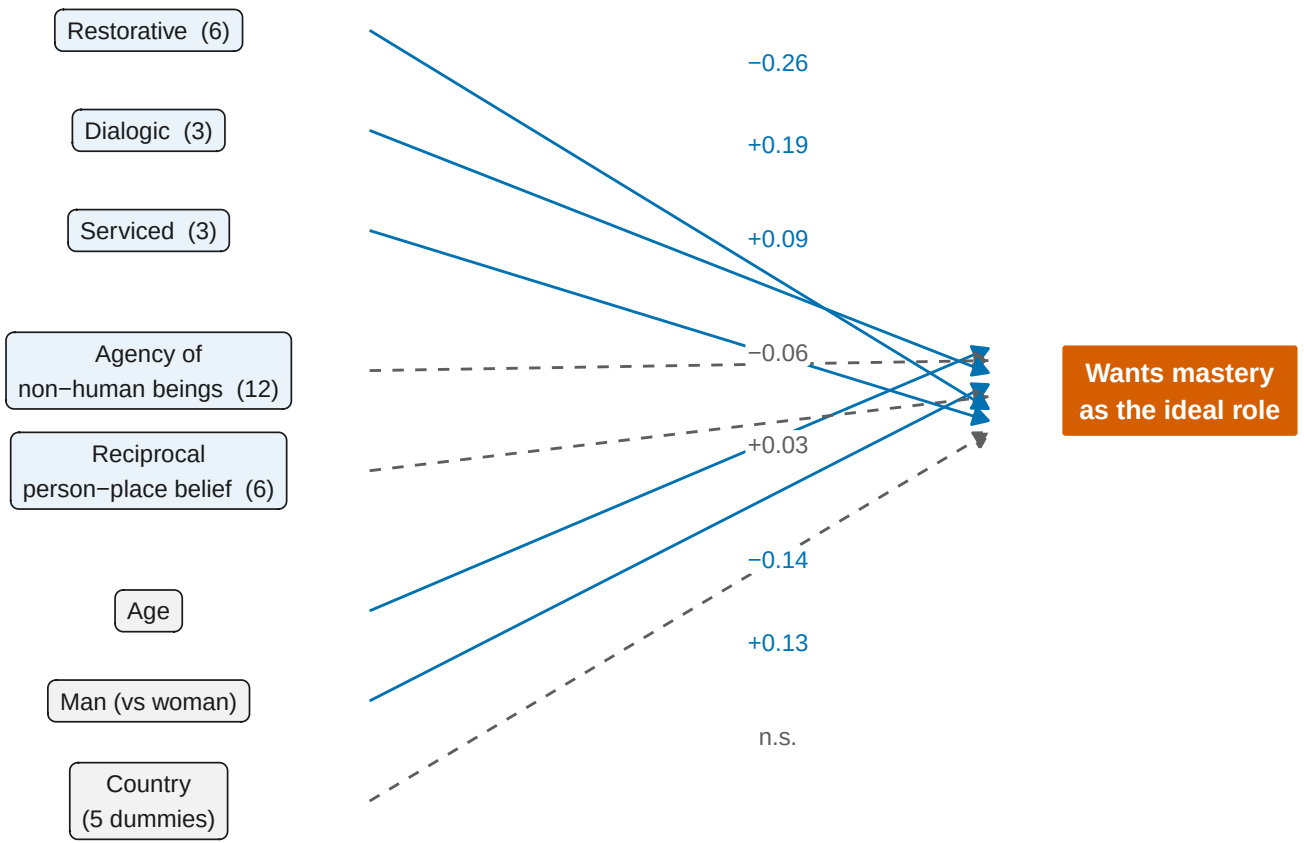
When every measure competes, the motives carry the prediction

Standardised paths to wanting mastery; latent variables are rounded, with their indicator counts



WLSMV, n = 2,489. Dashed grey paths do not reach p < .05. Adding the agency and belief scales to the motives raises R−squared from .1006 to .1012; no country differs significantly from Canada (the country effect as a whole is tested in 22_geography.R). The absorbed scales correlate .59 (belief with resto
