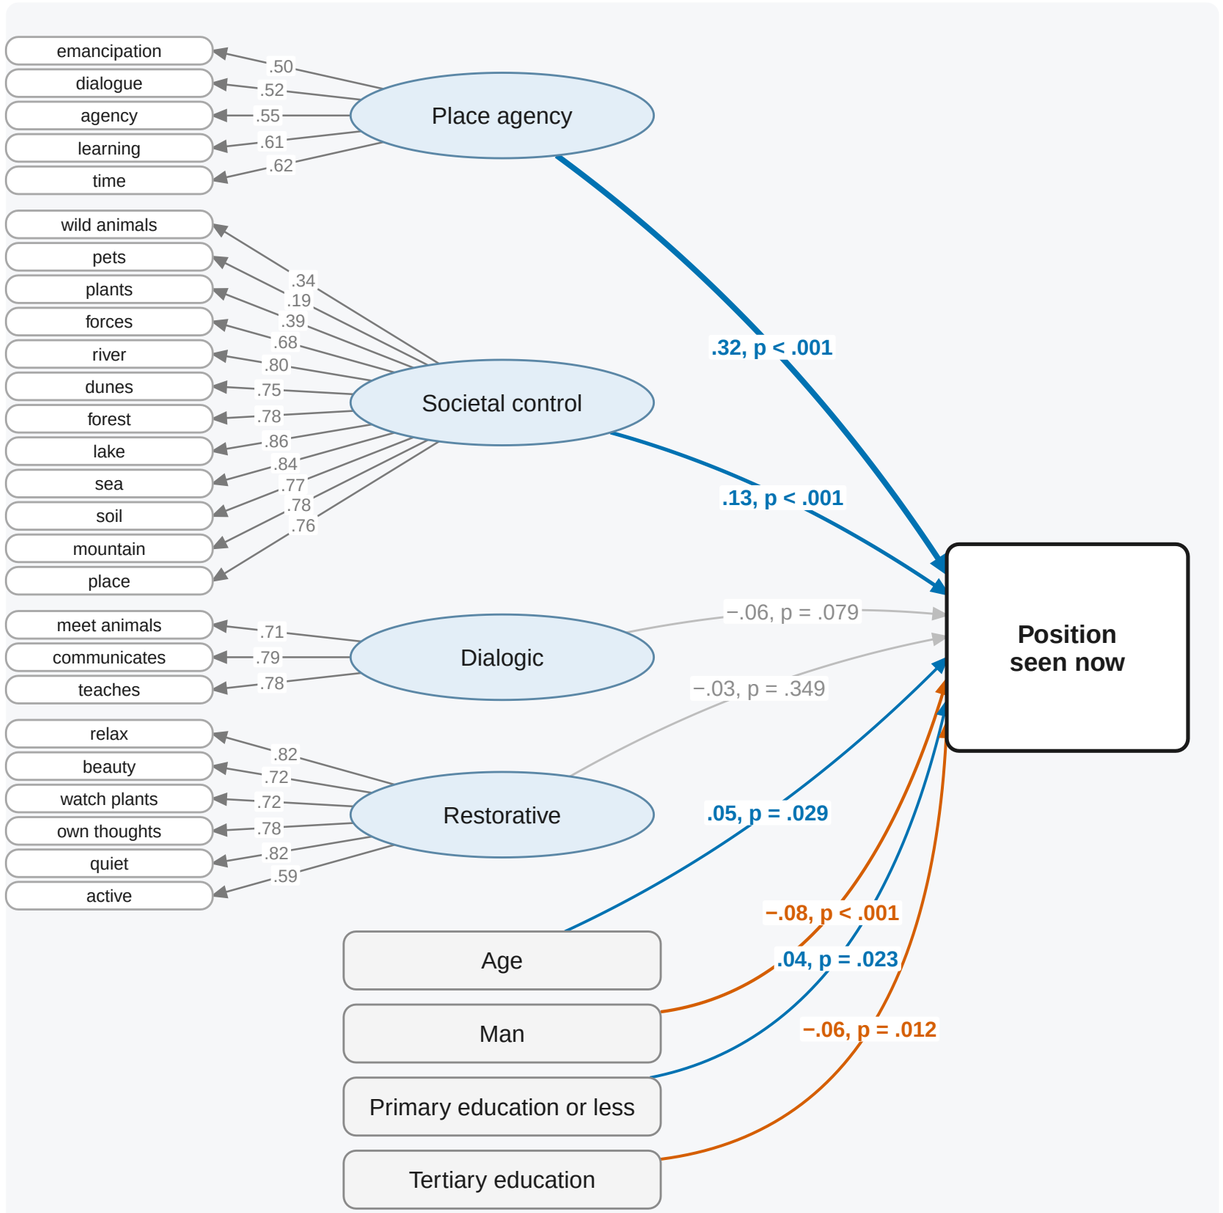
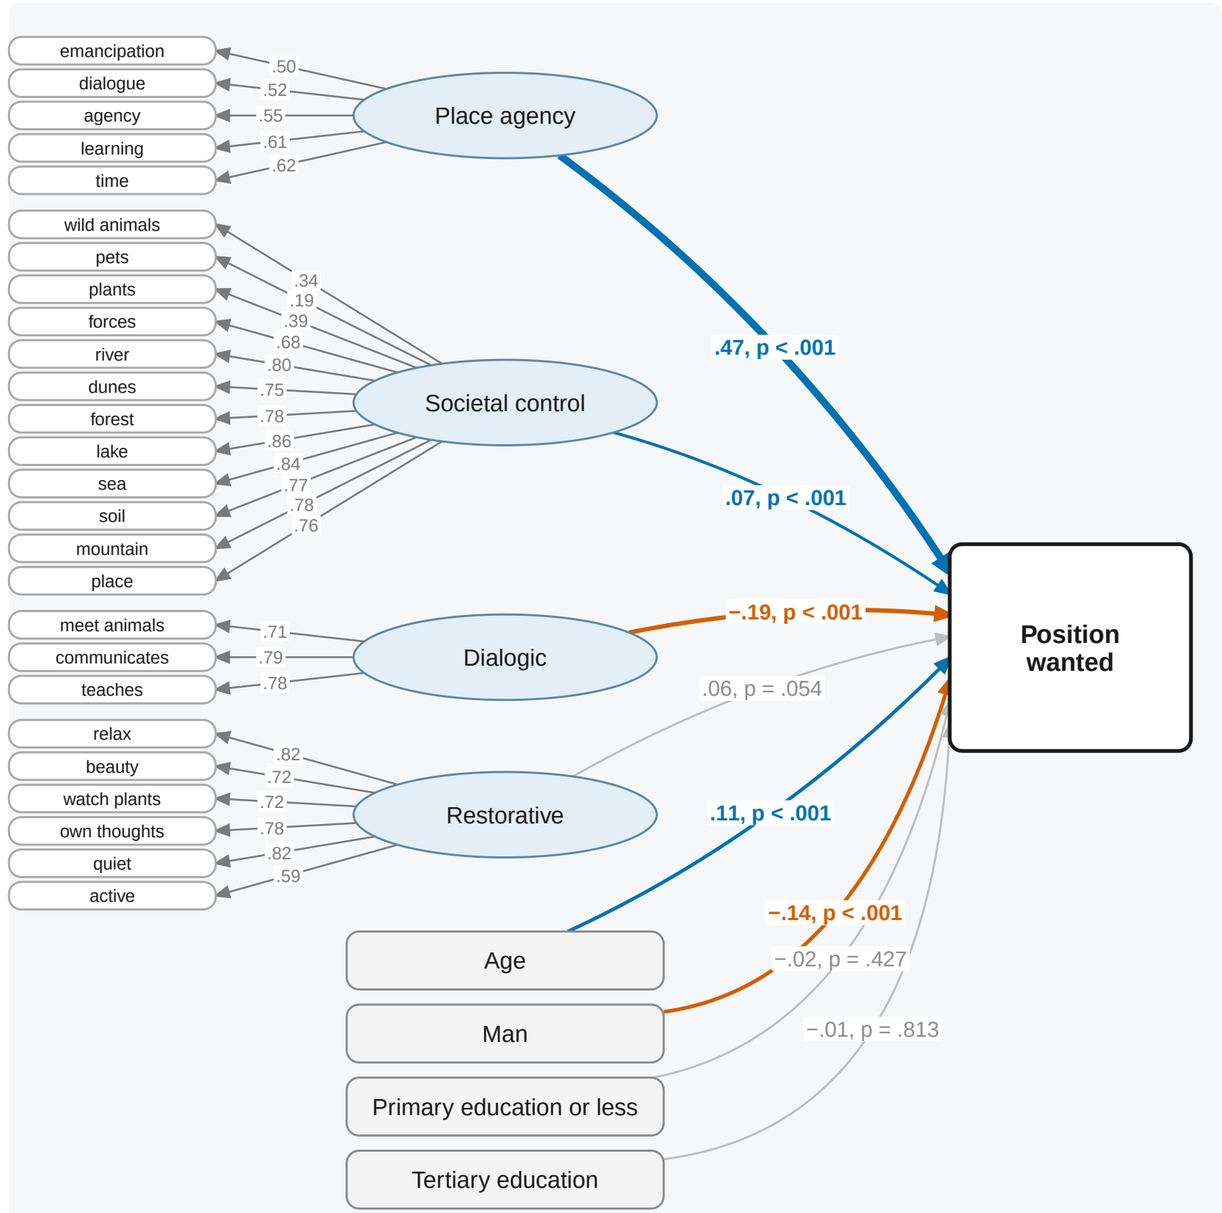
The wanted role sits further from Master the more agency a person grants a place, and that link is stronger for wanting than for seeing

Standardised estimates with exact p−values. Line width grows with the size of the path; grey lines are loadings.

The role people SEE (R² = 0.15)



The role people WANT (R² = 0.25)



WLSMV, n = 2,489; country dummies and a not−stated education flag are in the model, not drawn. The two outcomes keep a residual correlation of 0.29. Source: 26_ordered_sem.R

Position runs from Master (1) to Object (6): positive = a role further from Master.

Seen versus wanted, Wald test of each path: place agency p < .001; societal control p = .001; dialogic p < .001; restorative p = .013; age p = .006; man p = .014; primary education or less p = .006; tertiary education p = .041.
