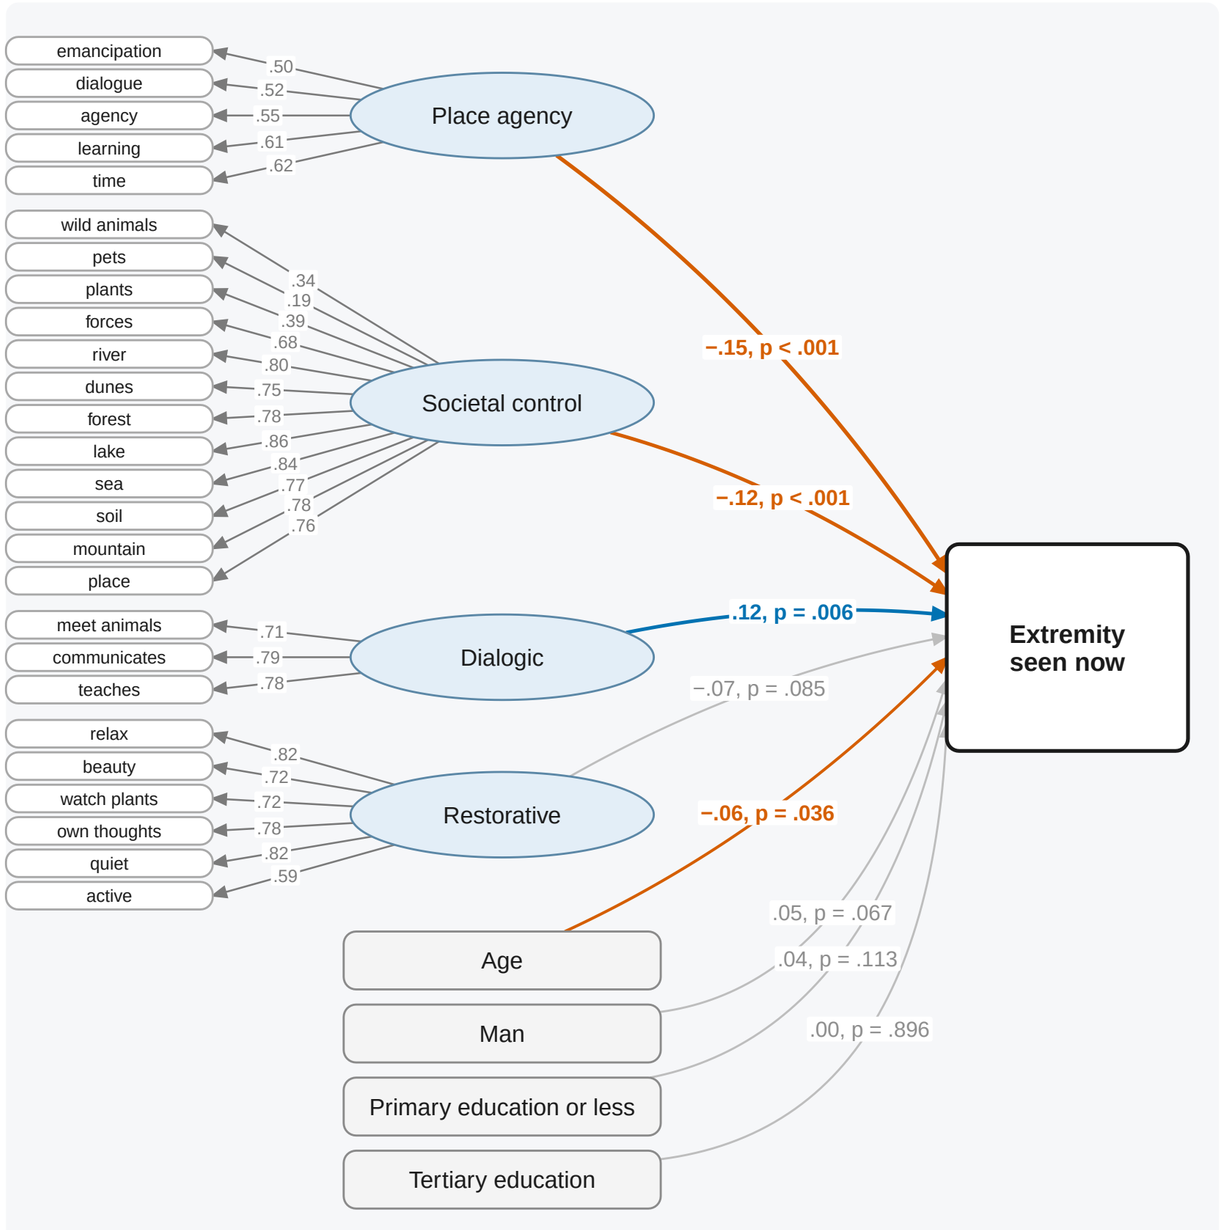
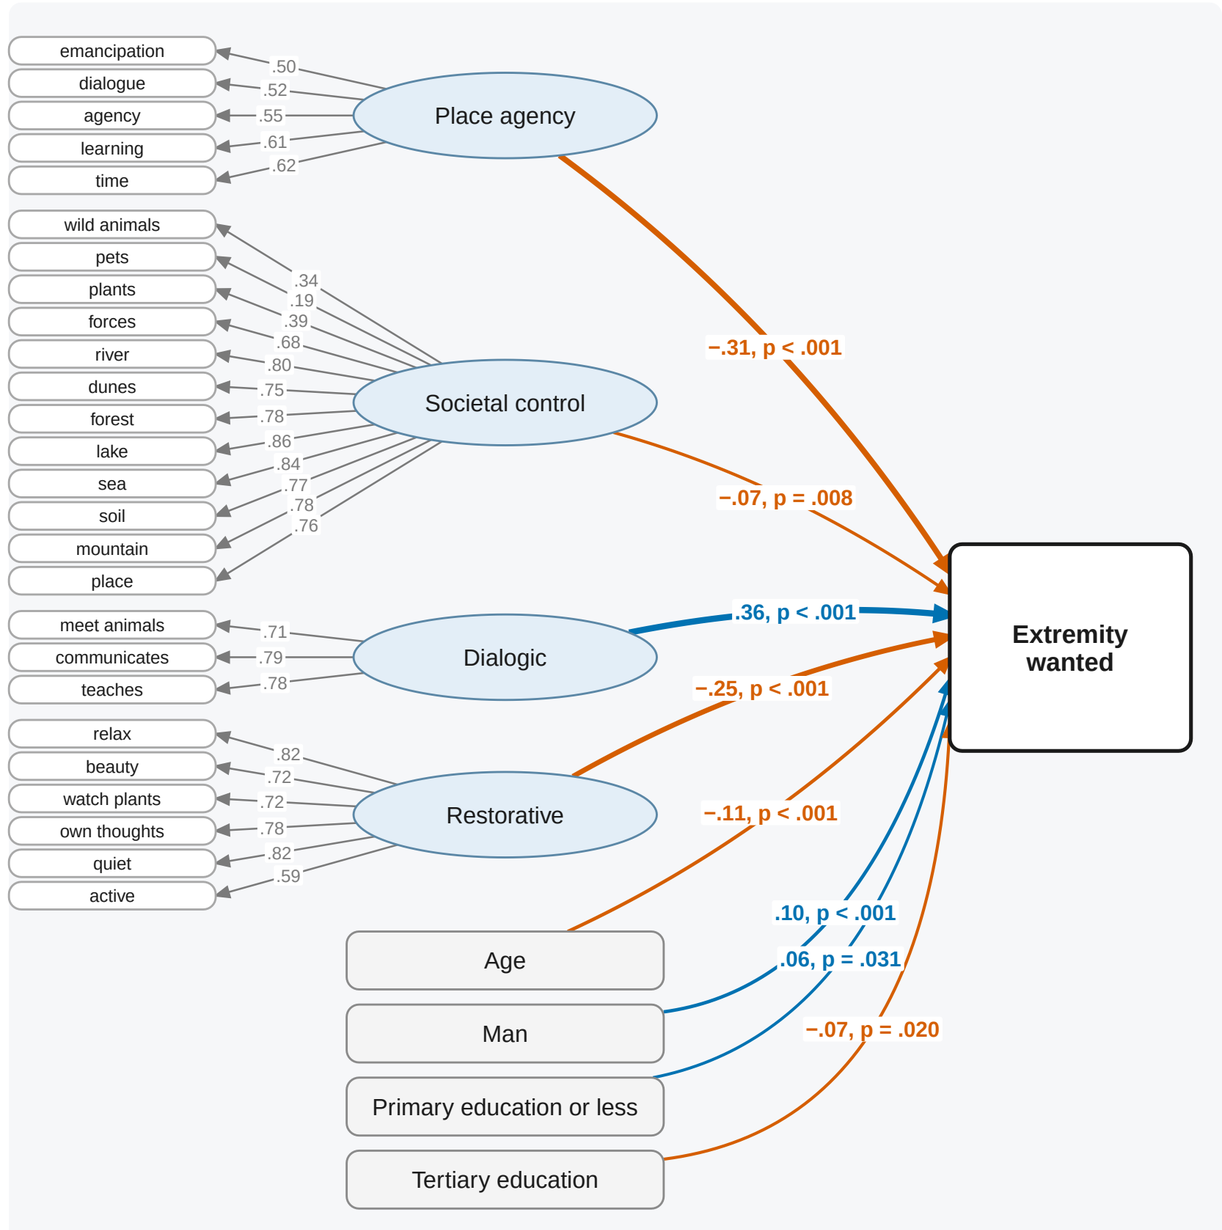
The motives act on how polarised the wanted role is: restorative experience lowers it, dialogic experience raises it

Standardised estimates with exact p−values. Line width grows with the size of the path; grey lines are loadings.

The role people SEE (R² = 0.09)



The role people WANT (R² = 0.20)



WLSMV, n = 2,489; country dummies and a not−stated education flag are in the model, not drawn. The two outcomes keep a residual correlation of 0.46. Source: 26_ordered_sem.R

Extremity = choosing either Master or Object. The place−agency and control paths are not interpretable (unequal pole sizes); read the motive paths.

Seen versus wanted, Wald test of each path: place agency p < .001; societal control p = .129; dialogic p < .001; restorative p < .001; age p = .139; man p = .079; primary education or less p = .635; tertiary education p = .032.
