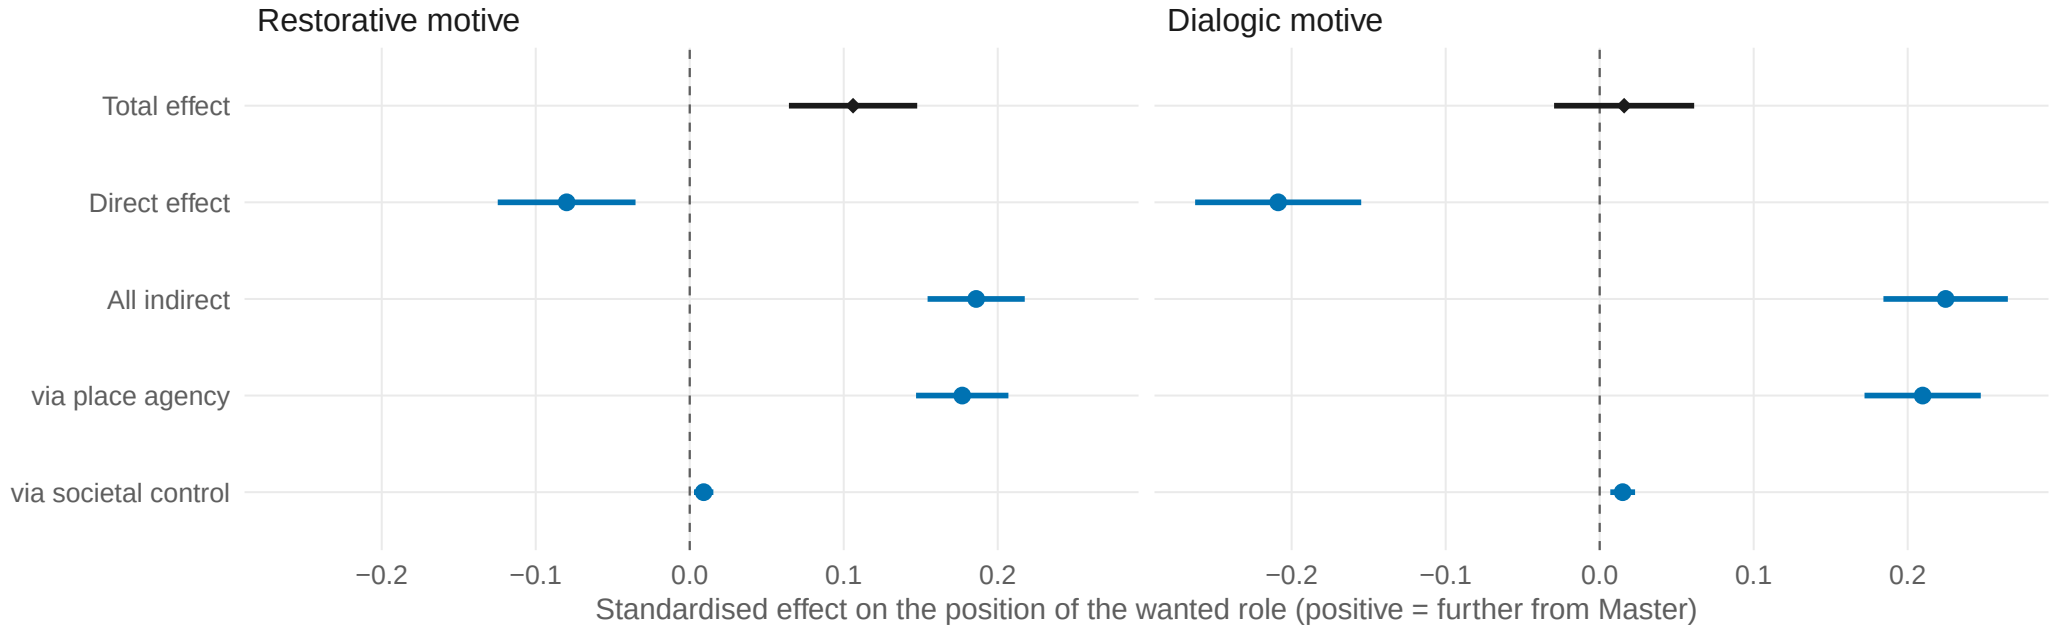
Both motives move the wanted role away from Master through place agency

For the dialogic motive a direct effect pulls the other way and the two nearly cancel; for the restorative motive the direct effect is small



One motive per model. Serviced is omitted (weak, low reliability) and extremity is not decomposed (no clean place−agency path).
Cross−sectional data, and the place−agency items were asked after the role question: consistent with mediation, not evidence of it. Source: 27_ordered_mediation.R
